CO1:Fundamentals of Generative AI and Large Language Models

T Bhanu Teja
192472259

1. Construct a comprehensive concept map tracing the evolution from Artificial Intelligence to Machine Learning, Deep Learning, Generative AI, and Foundation Models. Establish the relationships among these paradigms and explain how each stage addresses limitations of its predecessor.

2.Develop a concept map comparing discriminative models and generative models. Relate probability distributions, learning objectives, neural networks, training processes, and practical applications to demonstrate why Generative AI can create new content while discriminative models primarily perform prediction or classification.
